General

Uddeholm Unimax is a chromium-molybdenum-vanadium alloyed tool steel which is characterized by:

- Excellent toughness and ductility in all directions
- Good wear resistance
- Good dimensional stability at heat treatment and in service
- Excellent through-hardening properties
- Good resistance to tempering back
- Good hot strength
- Good thermal fatigue resistance
- Excellent polishability

Standard specification	None					
Delivery condition	Soft annealed to approx. 185 HB					
Colour code	Brown/grey					

Applications

Uddeholm Unimax is suitable for long run production moulds, moulds for reinforced plastics and compression moulding.

Uddeholm Unimax is a problem solver in severe cold work tooling applications such as heavy duty blanking, cold forging and thread rolling, where high chipping resistance is required.

Engineering and hot work applications requiring high hardness and toughness are also an option.

Properties

The properties below are representative of samples which have been taken from the centre of bars with dimensions 396 x 136 mm (15,6" x 5,35"), Ø 125 mm (4,93") and Ø 220 mm (8,67"). Unless otherwise indicated all specimens have been hardened at 1025°C (1875°F), gas quenched in a vacuum furnace and tempered twice at 525°C (975°F) for two hours; yielding a working hardness of 56–58 HRC.

Charpy-V specimens, longitudinal and short transverse direction. Approximate values for specimens from Ø 125 mm (4,9") bar.

Heat treatment— general recommendations

Soft annealing

Protect the steel and heat through to 850°C (1560°F). Then cool in furnace at 10°C (20°F) per hour to 600°C (1110°F), then freely in air.

Stress relieving

After rough machining the tool should be heated through to 650°C (1200°F), holding time 2 hours. Cool slowly to 500°C (930°F), then freely in air.

Hardening

Preheating temperature: 600–650°C (1110–1200°F) and 850–900°C (1560–1650°F).

Austenitizing temperature: 1000–1025°C (1830–1875°F), normally 1025°C (1875°F).

Holding time: 30 minutes

Temperature		Soaking time minutes	Hardness before tempering
°C	°F		
1000	1830	30	61 HRC
1025	1875	30	63 HRC

Soaking time = time at hardening temperature after the tool is fully heated through.

Protect the tool against decarburization and oxidation during austenitizing.

Quenching media

- High speed gas/circulating atmosphere.
- Vacuum furnace (high speed gas with sufficient overpressure).
- Martempering bath, salt bath or fluidized bed at 500–550°C (930–1020°F).
- Martempering bath at 200–350°C (390–660°F).

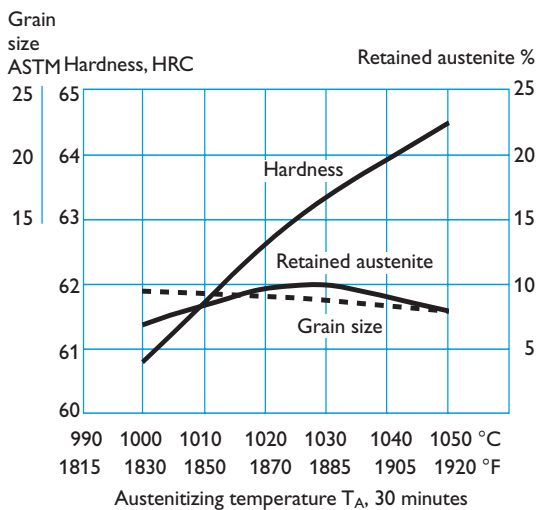

Note: Temper the tool as soon as its temperature reaches 50–70°C (120–160°F).

CCT GRAPH

Austenitizing temperature 1025°C (1875°F). Holding time 30 minutes.

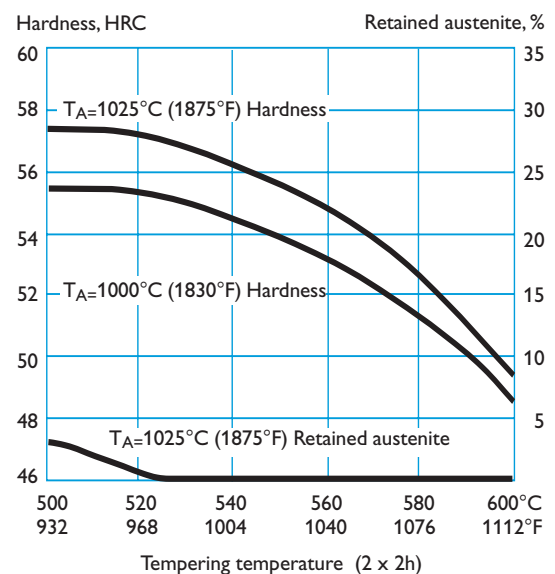

HARDNESS, GRAIN SIZE AND RETAINED AUSTENITE AS FUNCTIONS OF AUSTENITIZING TEMPERATURE

Tempering

Choose the tempering temperature according to the hardness required by reference to the tempering graph below. Temper at least twice with intermittent cooling to room temperature. The lowest tempering temperature which should be used is 525°C (980°F). The minimum holding time at temperature is 2 hours.

TEMPERING GRAPH

Dimensional changes during hardening and tempering

The dimensional changes have been measured after austenitizing at 1020°C/30 minutes (1870°F/30 minutes) followed by gas quenching in N₂ at a cooling rate of 1,1°C/second between 800–500°C (1470–930°F) in a cold chamber vacuum furnace. Specimen size: 100 x 100 x 100 mm (3,9" x 3,9" x 3,9").

Surface treatments

Tool steels may be given a surface treatment in order to reduce friction and increase wear resistance. The most commonly used treatments are nitriding and surface coating with wear resistant layers produced via PVD or CVD.

The high hardness and toughness together with a good dimensional stability makes Uddeholm Unimax suitable as a substrate steel for various surface coatings.

Nitriding and nitrocarburizing

Nitriding and nitrocarburizing result in a hard surface layer which is very resistant to wear and galling.

The surface hardness after nitriding is approximately 1000–1200 HV_{0,2kg}. The thickness of the layer should be chosen to suit the application in question.

PVD

Physical vapour deposition, PVD, is a method for applying wear-resistant surface coating at temperatures between 200–500°C (390–930°F).

CVD

Chemical vapour deposition, CVD, is a method for applying wear-resistant surface coating at a temperature of around 1000°C (1830°F).

Grinding

A general grinding wheel recommendation is given below. More information can be found in the Uddeholm publication “Grinding of Tool Steel”.

RECOMMEDED GRINDING WHEELS

Type of grinding	Soft annealed condition	Hardened condition
Face grinding straight wheel	A 46 HV	A 46 GV
Face grinding segments	A 24 GV	A 36 GV
Cylindrical grinding	A 46 LV	A 60 KV
Internal grinding	A 46 JV	A 60 IV
Profile grinding	A 100 LV	A 120 KV

Electrical Discharge Machining—EDM

Following the EDM process, the applicable die surfaces are covered with a resolidified layer (white layer) and a rehardened and untempered layer, both of which are very brittle and hence detrimental to die performance.

If EDM is used the white layer must be completely removed mechanically by grinding or stoning. After finish-machining the tool should be given an additional temper at approx. 25°C (50°F) below the highest previous tempering temperature. Further information is given in the Uddeholm brochure “EDM of Tool Steel”.

Welding

Welding of die components can be performed, with acceptable results, as long as the proper precautions are taken during the preparation of the joint, the filler material selection, the preheating of the die, the controlled cooling of the die and the post weld heat treatment processes. The following guidelines summarize the most important welding process parameters. For more detailed information refer to Uddeholm’s “Welding of Tool Steel” brochure.

Welding method	TIG	MMA
Preheating temperature	200–250°C (390–480°F)	200–250°C (390–480°F)
Filler material	UTP ADUR600 UTP A73G2	UTP 67S UTP 73G2
Maximum interpass temperature	350°C (660°F)	350°C (660°F)
Post weld cooling	20–40°C/h (45–70°F/h) for the first two hours and then freely in air.	
Hardness after welding	54–60 HRC	55–58 HRC
<i>Post weld heat treatment</i>		
Hardened condition	Temper at 510°C (950°F) for 2 h.	
Soft annealed condition	Soft-anneal according to the “Heat treatment recommendations”.

Network of excellence

Uddeholm is present on every continent. This ensures you high-quality Swedish tool steel and local support wherever you are. Assab is our wholly-owned subsidiary and exclusive sales channel, representing Uddeholm in various parts of the world. Together we secure our position as the world's leading supplier of tooling materials.

Uddeholm is the world's leading supplier of tooling materials. This is a position we have reached by improving our customers' everyday business. Long tradition combined with research and product development equips Uddeholm to solve any tooling problem that may arise. It is a challenging process, but the goal is clear – to be your number one partner and tool steel provider.

Our presence on every continent guarantees you the same high quality wherever you are. Assab is our wholly-owned subsidiary and exclusive sales channel, representing Uddeholm in various parts of the world. Together we secure our position as the world's leading supplier of tooling materials. We act worldwide, so there is always an Uddeholm or Assab representative close at hand to give local advice and support. For us it is all a matter of trust – in long-term partnerships as well as in developing new products. Trust is something you earn, every day.
